Chapter 178: The Blossoming of the Cosmos

Sung Jin-Woo’s divine act of planting the Second World Tree’s seeds transformed the multiverse in ways unimaginable. As the seeds took root across habitable and uninhabitable planets, the changes were profound, reshaping the cosmic landscape.

---

1. Transformation of Planets and Moons

Atmospheric Thickening

The Second World Trees absorbed raw mana and emitted purified mana into the air, causing atmospheres to thicken.

This process created breathable air and stabilized temperatures, enabling life to thrive even on previously inhospitable worlds.

Lakes of Mana

Around each World Tree, massive lakes of mana formed, glowing with vibrant energy.

These lakes became sources of immense power, supporting new ecosystems and serving as sanctuaries for mana-based creatures.

Soil and Gas Solidification

Planets and moons with gaseous surfaces, such as Jupiter and Saturn, began to solidify, forming rich, fertile soils.

Previously barren terrains on rocky planets like Mercury and Venus transformed into lush, verdant landscapes.

Galactic Influence

These changes weren’t limited to the solar system. Across galaxies, countless planets and moons experienced similar transformations, becoming havens for life and exploration.

---

2. Emergence of Mythical Creatures

Fruits of the Second World Tree

The fruits borne by the World Trees were unlike any seen before, radiating with divine energy.

When these fruits fell to the mana lakes, they gave birth to mythical creatures:

Phoenixes: Born from flames of purified mana.

Unicorns: Manifesting as symbols of purity and grace.

Dragons: Emerging as apex predators, ruling the skies.

Humanoid Celestials: Resembling angels, they possessed divine intelligence and unmatched power.

New Ecosystems

Each planet developed unique ecosystems tailored to its environment, with creatures adapting to their surroundings.

---

3. The Solar System’s Revival

Earth’s Neighbors

Mercury and Venus: Once hostile to life, they now boasted breathable atmospheres, mana-rich soils, and thriving ecosystems.

Jupiter’s and Saturn’s Moons: Moons like Europa, Titan, and others became lush worlds of endless possibilities.

Neptune and Uranus: Their gaseous layers condensed, revealing solid cores surrounded by vast oceans.

Pluto: The distant dwarf planet became a frigid, mysterious world teeming with resilient life forms.

Mana Bridges

The World Trees on nearby planets formed mana bridges, creating natural portals for interplanetary travel.

---

4. The Impact on the Multiverse

Unified Habitats

Every transformed planet became a sanctuary for life, welcoming beings from all corners of the multiverse.

Beings of every race—humans, dragons, elves, celestials, and shadow-born—found new homes among the stars.

Cosmic Economy

The mana lakes and World Trees became hubs for trade, exploration, and resource gathering, fostering interplanetary cooperation.

Devotion to Sung Jin-Woo

Worshippers across realms intensified their reverence, seeing these transformations as the ultimate proof of their deity’s unmatched power and benevolence.

---

5. Sung Jin-Woo’s Vision Fulfilled

From the Umbra Citadel, Sung Jin-Woo observed the fruits of his labor, his vision of a unified, thriving multiverse finally taking shape. He declared:

“Life shall flourish where none dared to dream. The barren shall bloom, and the desolate shall become sanctuaries of light. Creation knows no bounds.”

The multiverse rejoiced, with countless worlds now embodying Sung Jin-Woo’s ideals of abundance, unity, and endless potential.
